

## **ABSTRACT**

### **VOICEMAIL MESSAGING VIA SATELLITE RADIO**

A method and device for receiving a voice mail from a cellular phone service provider utilizing a satellite radio. When the cellular phone service provider determines that a called party's cellular phone is unable to receive a call because the called cellular phone is not within a live cell, the calling party is prompted to leave a voice mail message. The voice mail message is uplinked to a space satellite, which transponds the message to a one-way satellite radio receiver. The radio receiver sends the voice mail message to a coupled recorder. A repeater, coupled to the recorder, then transmits the voice mail message to the called cellular phone to a highly limited zone. The called party's cellular phone then receives the voice mail message as if it were one-way cellular phone call.
